but during the remainder of the week the amount was

but during the remainder of the week the amount was very variable. In England the extreme high daytemperatures ranged from  $6S_1^{\circ}$  at Eccles to  $56^{\circ}$  at Norwich and Hull, the general average all over the country being  $63_1^{\circ}^{\circ}$ . The extreme low night temperatures varied from  $33_1^{\circ}^{\circ}$  at Liverpool to  $26_1^{\circ}^{\circ}$  at Portsmouth, the general average being  $29_1^{\circ}^{\circ}$ . The range of temperature was  $33_3^{\circ}^{\circ}$ , vary-ing from  $41_0^{\circ}$  at Eccles to  $26^{\circ}$  at Hull. The mean high day temperatures ranged between  $56_1^{\circ}^{\circ}$  at Nottingham and  $43_1^{\circ}^{\circ}$  at Kecles to  $26^{\circ}$  at Hull. The mean high day temperatures ranged between  $56_1^{\circ}^{\circ}$  at Nottingham and  $43_1^{\circ}^{\circ}$  at Norwich, with a general average of  $53_1^{\circ}^{\circ}$ . The mean low night temperatures varied from  $36_1^{\circ}^{\circ}$  at Liverpool and Leeds to  $31^{\circ}$  at Portsmouth, with an average value of  $34^{\circ}$ . The mean daily range of tempera-ture was  $19_1^{\circ}$ , being as great as  $23_1^{\circ}^{\circ}$  at Portsmouth, Nottingham and Eccles, and as small as  $15_4^{\circ}^{\circ}$  at Norwich. The mean temperature for the week was  $42^{\circ}$ , the highest being at Sheffield and Leeds  $(43_2^{\circ}^{\circ})^{\circ}$ respectively, and the lowest at Norwich  $(39_1^{\circ}^{\circ}$  marily). Rain fell at Sheffield to the amount of nearly half an inch, being the largest amount recorded. At Hull a little more than a quarter of an inch was measured, but at Portsmouth and Birmingham no rain fell, the average amount over the country being but 12-100ths of an inch. Frequent and heavy snow showers prevailed at Bristol. Birmingham. Wolverbampton. Leicester

amount over the country being but 12-100ths of an inch. Frequent and heavy snow showers prevailed at Bristol, Birmingham, Wolverhampton, Leicester, Manchester, Bradford, and Hull, on April 23, 24, and 25. An aurora borealis was seen at Norwich on the 21st, between 9 and 10 P. M. A solar halo was seen at Liverpool on April 26. The weather at the beginning of the week was fine, but towards the end it was cold, with N.E. winds and heavy snow showers. In Scotland the highest temperatures ranged from  $65\frac{1}{2}^{\circ}$  at Glasgow to  $50\frac{3}{4}^{\circ}$  at Aberdeen, the lowest tem-peratures varied from  $33^{\circ}$  at Leith to  $25\frac{1}{4}^{\circ}$  at Faisley, their averages being  $60\frac{1}{4}^{\circ}$  and  $30\frac{3}{4}^{\circ}$  respectively. The mean temperature for the week was  $43^{\circ}$ , the highest being at Glasgow,  $44\frac{1}{5}^{\circ}$ , the lowest at Aberdeen,  $40\frac{3}{4}^{\circ}$ . Rain fell to the amount of a quarter of an inch nearly at Aberdeen, but at Edinburgh and Paisley none was measured, the average fall over the country being 6-100ths of an inch. At Dublin the highest temperature was  $63^{\circ}$ , the

At Dublin the highest temperature was  $63^\circ$ , the lowest 26°, the mean  $43\frac{1}{2}^\circ$ , and rainfall 0.00.

We understand that Mr. TURNER, the Royal Nursery, Slough, intends exhibiting at the Royal Horticultural Society's show, on Wednesday next, a full collection of ALPINE and SHOW AURICULAS, including some new varieties. Some of the NEW BELGIAN AZALEAS, alluded to by a correspondent in our last issue, may also be expected to be seen there.

## New Garden Plants.

CYPRIPEDIUM ARGUS, nov. sp. (Coriifolia tessellata) Pedunculo elongato; bractea ovarium longe non æquante; sepalo supremo impari a basi late oblonge triangulo, sepalis lateralibus connaits acutis labello bene brevioribus; tepalis ligulatis obtuse acutis porrecto divaricaits ciltatis ; labelli sacco juxta ostium retusum utrinque angulato; staninodio semiorbiculari antice retuso medio apiculato utrinque argute unidentato.

A Cypripedium in the way of C. barbatum, Lindl., but with very pale colours, enlivened by many dark blackish brown spots over the whole surface of the ciliate white brown spots over the whole surface of the cliate white petals, which have green veins and a brownish purplish apex. The plant is very remarkable, having the well-known upper sepal of Cypripedium purpuratum, Lindl, combined with the staminode and general appearance of C. barbatum, Lindl. A rigid botanist might call it an intermediate connecting link. I have not seen many presenter of Comparimentium purpursu an intermediate connecting link. I have not seen many specimens of Cypripedium purpuratam, but very many of C. barbatum in many varieties, all of which were constant in their circular upper sepal and in their staminode. It is not a grand Orchid, but it is a very curious addition to this lovely genus, that should be much recommended to beginners in collecting, since they are generally (excepting poor C. Fairrieanum) severely managed. At was discovered by Mr. Wallis when travelling for Messrs. Veitch. It flowered in April, 1873, and is believed by those gentlemen to come from Penang, while, I believe, Mr. Wallis told me it came from the Phillipines. To get certain in-formation we must wait till we meet Mr. Wallis once formation we must wait till we meet Mr. Wallis once more. It is named Argus in allusion to the numerous eye-like spots on the petals. H. G. Rchb. f.

### STARRY PUFF BALLS .- V. (Concluded from p. 577.)

(Concluded from p, 577.) 10. Geaster Michelianus, nov. sp. (fig. 115).—This is undoubtedly the finest Geaster in our flora, and at present has only been found in one locality, viz., amongst Rhododendrons at Castle Ashby, by Mr. Beech, the Marquis of Northampton's gardener; it has several times been sent to the meetings of the Royal Horticultural Society, and has been referred to under the name of G. tunicatus, Vitt., by Berkeley, in the Annals of Natural History (No. 1306), and under that of G. lagenæformis, Vitt., by Cooke, in his Handbook. The latter plant is now known to be British, and is quite different from G. Michelianus, a cut of which (taken from a hasty sketch by Mr. Fitch) accompanies the description of lagenæformis, Vitt., in Cooke's Handbook. We are indebted to the constant kindness of Mr. Berkeley for being at last able to identify the Castle Ashby for being at last able to identify the Castle Ashby

Geaster as the first plant of Micheli, and to publish it under a correct name, viz., G. Michelianus. Dried specimens have been issued with the *Erbario Critto*specimens have been issued with the *Erbario Critto-*gamico Italiano (343 and 979), gathered in 1862 and 1869, and published under the name of *Geaster tuni-*catus Michelianus, and from a careful examination of these plants and their fruit we can find no characters of moment to separate them from ours. Our plant is undoubtedly the Geaster figured by Micheli in the *Nova Plantarum Genera*, t. 100, f. I, under the name

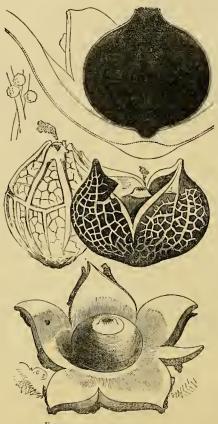

FIG. 115 .-- GEASTER MICHIEL'ANUS Half actual size ; section of inner peridium real size ; spores  $\times$  700 diam.

of Geaster major umbilico-fimbriato (though Fries erroneously relevs this plant to G. fimbriatus), and is the same with the G. tunicatus Michelianus of the Erb. the same with the G. tunication Michelianus of the Erb. Critt. Ital. There is, however, such an endless confusion of names, synonyms, poor figures, and imperfect descriptions of this, and one or two allied plants, that we publish Geaster Michelianus as a new species, and consider our British plant as the same with Micheli's figure (t. 100, f. I), the same with the dried specimens in the *Erb. Critt. Ital.* 343 and 979,

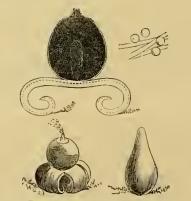

FIG. 116. -- GEASTER LAGEN.&FORMIS. Half actual size ; section real size ; spores × 700 diam

and distinct both from G. lagenæformis, Vitt., and G.

and distinct hoth from G. lagenæformis, Vitt., and G. tunicatus, Vitt. The following description is prepared from fresh British specimens:—Outer peridium pale buff, thick, fleshy, generallysplitting into fiveorsix sub-equal lacinice, clothed on the outside with a thin dark brown bark, which again splits into elegant honeycombed patterns; inner peridium pale slatey buff, spherical; mouth pro-minent, obtuse, dentate, paler in colour than the body of the inner peridium; spores slightly tuberculoso-echinulate, .00014" diameter (in which measurement the English and Italian specimens exactly agree). When mature, and when the outer peridium bursts,

this plant throws itself sometimes 9 inches away from its place of growth. The way in which the base of the inner peridium is seated on the centre of the stel-

late outer peridium is very extraordinary. 11. Geaster lagenaformis, Vitt. (fig. 116).—We are indebted to Mr. Edward Parfitt, of the Devon and Exeter Institution, for the materials wherewith to figure and describe this elegant and distinct species.

Exercise Institution, for the mechanis whetering species. I figure and describe this elegant and distinct species. I fitherto it has not been published as British, though we believe we recently had the same plant scat us from Norfolk through Mr. Charles B. Plowright. Mr. Par-fitt's specimens were found in Stoke Wood, near Exeter, in November, 1868; one or two were after-wards seen in the same locality in 1869, but since that time they appear to have vanished from the spot. The following is Vittadini's description :----"Outer peridium splitting to the middle, in rearly equal acuminate lacinice, inner stratum very thick, evanescent. Inner peridium sessile, flaccid; mouth determinate, plano-conic, ciliato-fimbriate, columella rather long, clavate." Mr. Parfitt adds to this :---"Outer peridium white, with furfuraceous brown scales towards the base, at length expanding into six rigidly recurred lacinice; these sometimes again dividing so as to make six or eight more lesser segments; inner stratum very six or eight more lesser segments; ioner stratum very thick and brittle, cracking on the least pressure being applied. When the lacinic first expand, the inner stratum is a beautiful rosy-white colour. Inner peridium about two shades darker in that than the inner stratum, about two shades darker in that that the infer stratum, and appearing under a lens to be finely felted together; round the mouth a depressed ring, in which the felted appearance is more strongly developed, directed upwards and forming the mouth, which is conic, nearly smooth and very finely fimbriated." The Exeter plants exactly accord with Vittadini's published figure. In inforce, the plant strongly resembles an antique

In infancy the plant strongly resembles an antique jar with narrow mouth, hence the specific name. The spores are perfectly round and smooth, thus differing from the majority of Geasters, and measure .00012"

diameter. Mr. Parfitt has kindly furnished sufficient dried materials for recognition to the Royal Herbarium at Kew and the herbarium at the British Museum. The Kew and the herbarium at the British Museum. The Kew herbarium now possesses nine of the 11 British species, being deficient of G. coliformis, P., and G. mammosus, Chev. The British Museum has one more plant than Kew in a capital specimen of G. coli-formis, P. (the Bloomsbury G. mammosus not being Sowerby's plant). Out of the nine British species at Kew, and the 10 at the British Museum, six each have been indirectly furnished through correspondents of the Gardeners' Chronicle. Worthington G. Smith.

### Notable Gardens.

MESSES. STANDISH & Co., ROYAL NURSERIES, ASCOT.—There are a few floral features about these nurseries that are well worthy a slight notice. Fore-most among these are the Cinerarias, for the value of which this firm has gained some notoriety. They can now he can growing in large supprise in and most among these are the Cinerarias, for the value of which this firm has gained some notoriety. They can now be seen growing in large quantities in cold frames, and they are distinguished by their compact, free-branching habit, finely formed, and rich-hued flowers, represented by many pleasing shades, and by their great substance. It would be a very easy matter to select from them a dozen varieties, quite distinct, and so thoroughly good as to be worth naming, which could hold their own against the cultivated varieties of the best raisers. There is clearly perceptible a steady advance in the tricolor section, as they are termed, and it is the ruling characteristic of these to have a circle of white, sometimes narrow and sometimes broad, forming a zone ruling characteristic of these to have a circle of white, sometimes narrow and sometimes broad, forming a zone round the disc; then a distinct ring of some bright colour, shaded off into a marginal colour of a deeper hue. Splendidly coloured self flowers are also com-prised, and snow-white selfs, that are perhaps more wanted than any other colour among Cinerarias. Spring-blooming Clematises—varieties raised mainly from C. Standishii fertilised with others—are in large numbers at the Ascot aurscrices, many of them por-

numbers at the Ascot aurscries, many of them poi-sessing hues of violet and blue, colours wanted in the early-flowering section. There is just a danger of being overdone with these beautiful flowers just now, as many new varieties are being introduced; but Mr. Standish asserts that some of his have quite a distinctive character of their own, and that they capacit fail to be Standish asserts that some of his have quite a distinutive character of their own, and that they cannot fail to be acquisitions. It is singular to note that though C. Fortunei has been much employed by Mr. Standish as a pollen parent, no double flower has yet appcared among the numerous progeny. A large quantity of these Clematises have just been sent to Birmingham, for the purpose of being planted in a portion of the large tent used by the Royal Horticultural Society on the occasion of the great provincial show in June last— Mr. II. G. Quilter, with that characteristic enterprise which shows itself in all his doings, having roofed in a good portion of the tent with glass, and is having it planted with these Clematises and early flowering Rhododendrons. C. Lucie Lemoine is grown here as the best, as it is the only, pure white double Clematis in cultivation.

Forced Roses for the provision of cut flowers are Forced Koses for the provision of cut howers are most extensively grown at Ascot, while the propagatioa of varieties, such as the choice Tea sorts, for sale, is something marvellous. There are two white Hybrid Perpetuals that are largely grown for cut flowers, viz., Boule de Neige and Coquette des Blanches. The
