OF THE THIRD SERIES;

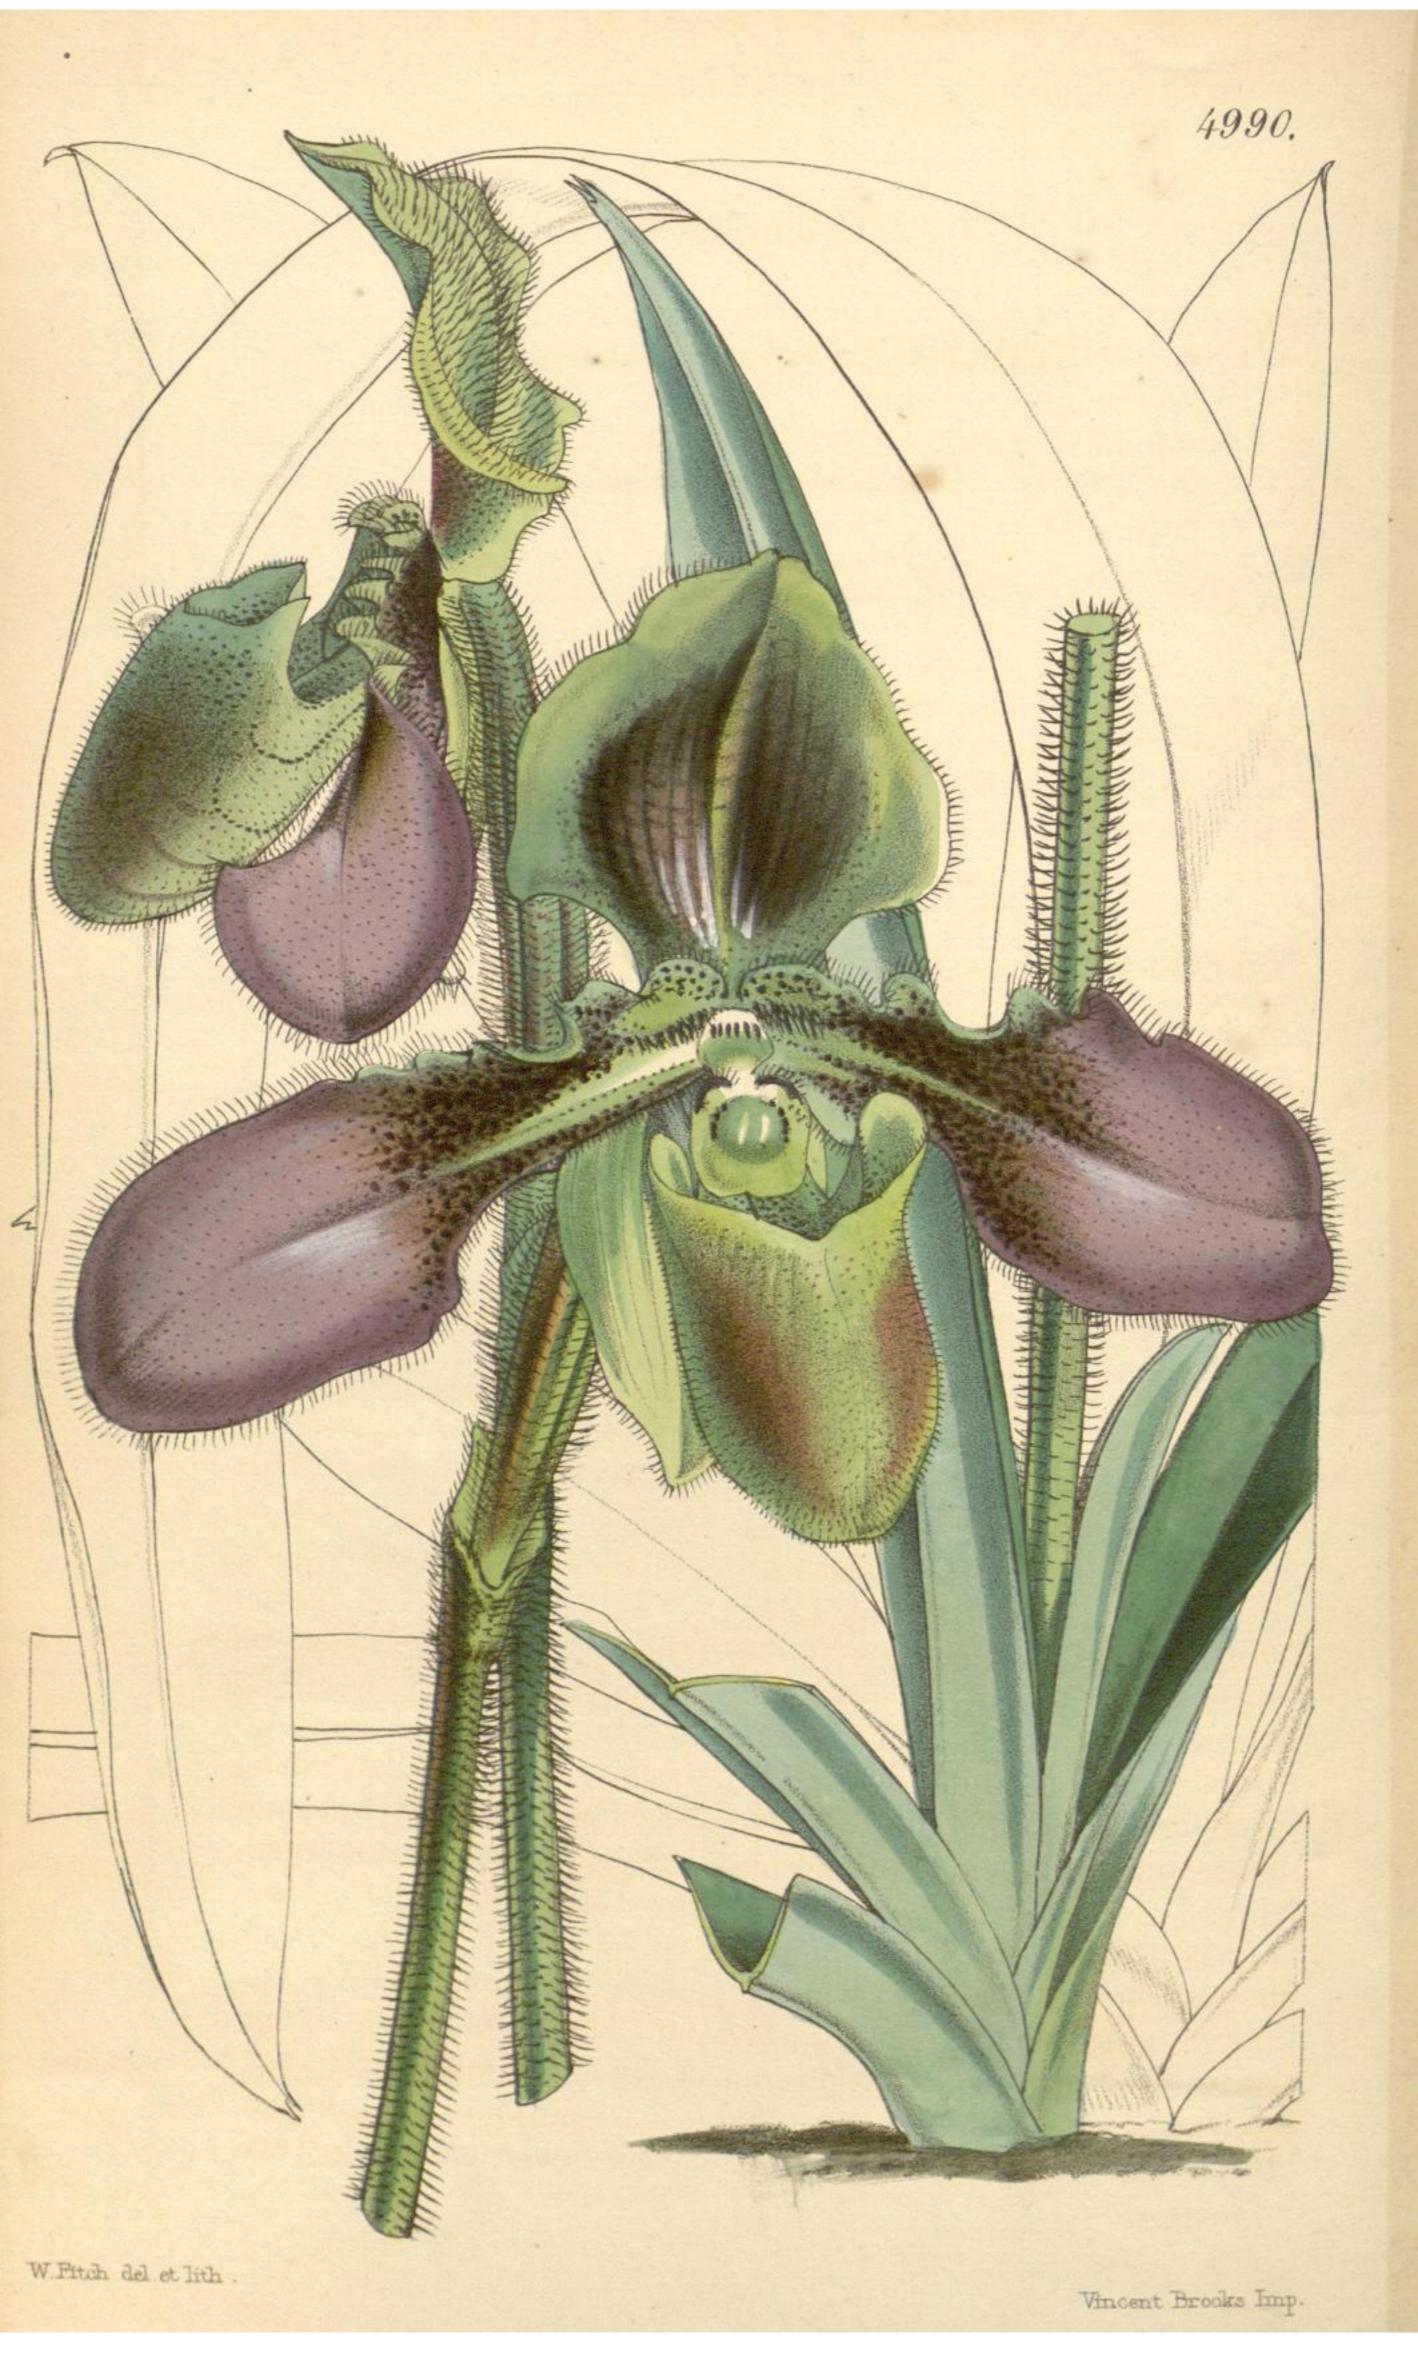

(Or Vol. LXXXIII. of the Whole Work.)

"The God of seasons, whose pervading power Controls the sun, or sheds the fleecy shower, He bids each flower his quickening word obey; Or to each lingering bloom enjoins delay."—White.

LONDON: '

LOVELL REEVE, HENRIETTA STREET, COVENT GARDEN.
1857.

Тав. 4990.

CYPRIPEDIUM HIRSUTISSIMUM.

Villous Lady's Slipper.

Nat. Ord. ORCHIDEÆ.—GYNANDRIA DIANDRIA.

Gen. Char. (Vide supra, TAB. 4901.)

Cypripedium hirsutissimum; acaule, foliis distichis elongatis loratis acutis costatis enerviis basi carinatis canaliculatis equitantibus unicoloribus, floribus hirsutis, scapo bractea sepalisque dorso villosissimis, sepalo dorsali amplo latissime cordato-acuto, petalis amplis lato-spathulatis ungue profunde sinuato-lobato, sepalis lateralibus in unum ovatum coadunatis labello brevioribus, stamine sterili obtuse quadrato angulis obtusis.

CYPRIPEDIUM hirsutissimum. Lindl. MSS.

A native of Java, we believe, and communicated to us by Mr. Parker, of Hornsey, who purchased it at a sale of East Indian plants. It is an extremely handsome species of the stemless group of Cypripedium, allied to C. insigne, villosum, Lowii, and barbatum; nevertheless abundantly distinct from all. The first of those just mentioned, "C. insigne, is only tomentose, and its petals want the spathulate form, long hairs, and strong undulation; C. villosum has longer flowers, no undulation or beard or ciliation of the petals, and has the sterile stamen truncate, not quadrate. Of C. Lowii, the long, flat, naked petals are quite different. C. barbatum has a circular, not quadrate, sterile stamen, spotted short leaves, and wants the shagginess. In C. purpuratum the sterile stamen is lunate, etc." (Lindl. MSS.); -to which may be added the marking of the flowers, and the colour, which is particularly rich, of various tints of purple and green, brighter and handsomer than in any species known to me. It flowered in the stove in April 1858.

Descr. Stemless. Leaves often a foot and more long, linear-oblong or ligulate, acute or bifid at the point, distichous, cari-

JUNE 1st, 1857.

nated, channelled and equitant at the base, costate, but not conspicuously striated, of a uniform green colour, and quite glabrous. Scape about equal in length to the leaves, terete, green, tinged with dark purple, villous or rather shaggy, as are the bractea, ovary, and whole back of the flower, with long, spreading hairs, suggesting Dr. Lindley's specific name. Bract broadovate, sheathing, single-flowered. Pedicel short, almost included within the sheath. Sepals all ciliated; superior one broad, rhomboidal-cordate, the margins at length reflexed, dark purplishgreen, striated, quite green at the margin. Lateral sepals green, united into one, of an ovate form, striated, shorter than the lip. Petals very large, spreading horizontally, broad-spathulate, ciliated, the lamina purple, the claw green, mottled and dotted with purple, singularly lobato-undulated at the margin. Lip large, deep green, with a tinge of purple, the margin ciliated. Column short, and, as well as the square sterile stamen, obtuse at the angles and with a swelling or boss in the centre, variegated with green and white, and spotted with dark purple.

all development and the second second
